Develop visible local metrics
- **ADMINISTRATION**
Problem solving process
Alignment with work management process
- **Inventory of parts/cost management**
- **PROJECT MANAGEMENT**
An essential part of asset management; metrics and funding management

SOLUTIONS THAT WORK FOR YOUR BUSINESS

Looking after your assets can be a complex and difficult task.

The Asset Management process brings together the **integration** and **coordination** of a broad range of equipment reliability activities into one process in which key equipment is identified and evaluated against a matrix;

The 'health' of the assets is monitored and analysed; the level of problem reports/ actions are prioritised; continuous improvements to preventative maintenance tasks based on asset operating experience; and implementation of long-term asset health plans.

Knowing how well your systems are working, (System Health), knowing and defining a plan of maintenance, repair and replacement (Asset Care) and Materiel Condition and Life Cycle Management are the three core elements of this solution.

There is also clear alignment between Asset Reliability and Work Management to maximize your asset availability and reduce downtime. Operational Focus and Problem Solving are also a key influencer in this area.
